Natalia Levshina : How to do Linguistics with R: Data exploration and statistical analysis before purchasing it in order to gage whether or not it would be worth my time, and all praised How to do Linguistics with R: Data exploration and statistical analysis:

3 of 4 people found the following review helpful. like "extendeing linear models" by Faraway (great bookBy P.RotondoI have read several books on linear and non linear models, like "extendeing linear models" by Faraway (great book, recommended), data science and Data analysis in R by Friendly and Meyer, and many others, also on text mining, but this is definitely the "best written", clean explanation of all arguments, and mostly: arguments are exposed

in very coherent and exhaustive way; of course it's focused on linguistic analysis, but concepts and tools are perfectly applicable to any data analysis's field.

This book provides a linguist with a statistical toolkit for exploration and analysis of linguistic data. It employs R, a free software environment for statistical computing, which is increasingly popular among linguists. *How to do Linguistics with R: Data exploration and statistical analysis* is unique in its scope, as it covers a wide range of classical and cutting-edge statistical methods, including different flavours of regression analysis and ANOVA, random forests and conditional inference trees, as well as specific linguistic approaches, among which are Behavioural Profiles, Vector Space Models and various measures of association between words and constructions. The statistical topics are presented comprehensively, but without too much technical detail, and illustrated with linguistic case studies that answer non-trivial research questions. The book also demonstrates how to visualize linguistic data with the help of attractive informative graphs, including the popular ggplot2 system and Google visualization tools.
